

THE STANDARD for PRESERVATIVE TREATED and COLOURED OUTDOOR WOOD PRODUCTS!

MICROPRO SIENNA IS THE NAME FOR WOOD PRODUCTS TREATED WITH A COMBINATION OF MICROPRO® AND MICROSHADES®.

The treatment is a unique combination of micronized copper preservatives and iron oxide colour pigments which are pressure treated into the wood. This means that the wood is not only protected against fungal decay and termite attack, the longer lasting micronised colour pigments penetrate the wood for colour that is not just "skin deep".

MICROPRO SIENNA COLOUR

MicroPro Sienna micronized technology gives the treated wood a rich finished look that complements today's outdoor environments. Designed to meet the style demands of indoor/outdoor living, it offers a finished look similar to hardwoods and merbau with no initial staining.

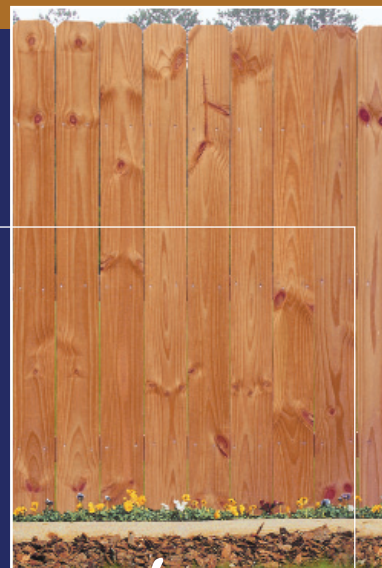

In an exterior project, the colour of MicroPro Sienna will turn to warm tan and over the years will gradually fade to driftwood grey. The length of time will vary according to sunlight exposure, the wood species and the application. Any initial green colour that may appear around knots and grain features will change to a tan colour and blend with the overall look.

landscaping

MICROPRO SIENNA IS:

- A one step process, MicroPro with MicroShades
- One colour, red/brown chosen for the Australian market and dosed to give consistent colour match
- A non-arsenic based preservative formula suitable for above ground and in-ground use.
- Long lasting colour proven over time
- Backed by the Osmose guarantee against fungal decay and termite attack
See guarantee document for details.
